

Lab Activity Report: Introductory HTML Document Structure

Objective

- **Primary Goal:** Construct a well-structured, static HTML document using semantic heading levels (`<h1>` to `<h3>`) and paragraph elements (`<p>`) to build an information hierarchy.
- **Secondary Goal:** Demonstrate understanding of how the browser interprets document tree ordering and basic text nodes without external styling or interaction layers.

Code Analysis & Component Breakdown

HTML Tag	Rendered Text	Structural Purpose
<code><h1></code>	Welcome to freeCodeCamp	Primary Heading: Serves as the main title/document root identifier.
<code><h2></code>	Full-Stack Curriculum	Secondary Heading: Defines a major sub-topic under the main title.
<code><p></code>	Learn the skills to become...	Paragraph: Provides context/description for the <code><h2></code> section.
<code><h3></code>	Introduction to HTML	Tertiary Heading: Denotes a specific subject module under the curriculum.
<code><p></code>	HTML represents the content...	Paragraph: Defines the core function of HTML.
<code><h3></code>	Introduction to CSS	Tertiary Heading: Denotes a sibling subject module alongside HTML.

<code><p></code>	CSS is used to style a webpage	Paragraph: Defines the core function of CSS.
------------------------	--------------------------------	---

Observations & Technical Insights

- **Heading Hierarchy:** The document adheres to accessibility standards by nesting heading levels incrementally (`<h1>` $\rightarrow$ `<h2>` $\rightarrow$ `<h3>`) without skipping levels (e.g., avoiding an jump from `<h1>` to `<h3>`).
- **Default Display Types:** All tags used (`<h1>`, `<h2>`, `<h3>`, `<p>`) are block-level elements by default, causing the browser user-agent stylesheet to stack them vertically with default margins.

Conclusion

This activity successfully demonstrates the foundational principles of HTML markup. By utilizing appropriate heading levels and paragraph tags, the document establishes a clear content hierarchy that is both human-readable and accessible to screen readers and search engines. While CSS handles presentation and JavaScript handles behavior, this snippet represents the fundamental structural layer necessary for any web application.

Step 11 ✓

Finally, JavaScript makes your webpage interactive — it lets you tell the page what to do when someone clicks a button, submits a form, or many other things.

For the last step of the workshop, add another `h3` and `p` element to the page describing JavaScript.

First, add an `h3` element with the text:

Introduction to JavaScript

Then, below that `h3` element, add a `p` element with the following text:

```
