Lab Objectives

- Application of semantic HTML5 markup to create an accessible and logically structured web document.
- Implementation of CSS for visual design, including background imagery, typography, and color schemes.
- Utilization of CSS layout techniques to align elements, specifically centering blocks and structuring itemized lists.

Knowledge Acquired

- **Semantic HTML:** Correct usage of tags like `<main>`, `<section>`, `<article>`, and `<address>` to define the layout's structural hierarchy.
- **The Box Model:** Application of `margin`, `padding`, `width`, and `max-width` to control element spacing and ensure the main container remains responsive and centered on the page.
- **Inline-Block Layout:** Using `display: inline-block` alongside percentage-based widths (75% for item names, 25% for prices) to format a clean, horizontal receipt-style layout.
- **Link States:** Styling interactive elements using pseudo-classes (`:visited`, `:hover`, `:active`) to provide visual feedback to users.

Demonstrated Capabilities

- Constructed a complete HTML document from scratch and properly link it to an external CSS stylesheet.
- Embedded and formatted external visual assets seamlessly using `<img>` tags and CSS `background-image` properties.
- Manipulated typography globally and locally using specific font families (Impact, sans-serif) and stylistic overrides.
- structured data rows without using tables, relying entirely on CSS display properties.

The completion of this cafe menu demonstrates a practical command of core web development fundamentals. By successfully separating structural content (HTML) from visual presentation (CSS), this exercise confirms the technical readiness to design, style, and structure custom, responsive web interfaces efficiently.
